

# GETTING GOING WITH COLDFUSION BUILDER

Charlie Arehart, Independent Consultant  
CF Server Troubleshooter  
charlie@carehart.org  
@carehart (Slack, Github, X, Fb, LI, etc.)

Updated Sep 23, 2025

Slide deck:  
[carehart.org/presentations](https://carehart.org/presentations)

- ▶ CFBuilder: the free extension for the free VSCode editor
  - ▶ Some common initial questions
  - ▶ Installation (including on vsodium)
- ▶ Features and benefits
  - ▶ VSCode features
  - ▶ CFB basic features
  - ▶ CFB configurability; features which require additional configuration (in CFB and/or CF)
- ▶ Comparison to other VSCode CFML extensions
  - ▶ What they offer that CFBuilder does not; What CFBuilder offers that they do not
- ▶ Some more on CFB and VSCode
- ▶ Resources for finding more on both

# TOPICS

- ▶ I focus on CF server troubleshooting, as an independent consultant
  - ▶ Assist organizations of all sizes, experience levels
  - ▶ Work remotely 99% of the time, safe, secure, easy (via **shared desktop**)
  - ▶ **Solve most problems in less than an hour**, teaching you also as we go
  - ▶ **Satisfaction guaranteed**
  - ▶ More on rates, approach, online calendar, etc at [carehart.org/consulting](https://carehart.org/consulting)
- ▶ But to be clear, I'm not selling anything in this session! 😊
- ▶ Again, slides for this talk available online:
  - ▶ [carehart.org/presentations](https://carehart.org/presentations)

ME.ABOUT()

- ▶ There are many different potential audiences for this talk:
  - ▶ Those who love CFB and look forward to learning more
  - ▶ Those who have heard of CFB on VSCode and want to learn more
  - ▶ Those who knew of old Eclipse version, unaware of VSCode extension
  - ▶ Those who have never heard of CFBuilder
  - ▶ Those who have never heard of VSCode
  - ▶ Those who use VSCode or CFB, as “a text editor” and expecting nothing more
  - ▶ Those who get frustrated with not finding things they expect from other editors
  - ▶ Those who have tried CFB on VSCode and hit problems
  - ▶ Those familiar with other VSCode CFML extensions, who may fit in the above

# AUDIENCES

- ▶ Before we go any further, let's make a few points clear
- ▶ VSCode is free, open source, from Microsoft
  - ▶ Formally “Visual Studio Code”, aka simply “code” (NOT Visual Studio)
  - ▶ Huge marketplace of free extensions from the community and vendors
  - ▶ By some estimates, VSCode used by most developers across most languages
- ▶ CFBuilder (aka “CFB”) is free, closed source, from Adobe
  - ▶ Extension first released in July 2022; a few updates since then
- ▶ Original CFBuilder: commercial and closed source, based on Eclipse
  - ▶ Last updated with CF2018, retired in 2024
- ▶ CFB on Vscode available for Windows, MacOS, Linux

## CFBUILDER: THE FREE ADOBE EXTENSION FOR THE FREE MS VISUAL STUDIO CODE EDITOR

- ▶ What's the relationship of VS Code to MS Visual Studio?
- ▶ Why did Adobe choose to leverage VSCode?
- ▶ What about existing CFML extensions for VSCode?
- ▶ Is there an available open source alternative? Yes: VSCodium (aka "codium")
- ▶ What happened with Dreamweaver and CFStudio/HomeSite+?

## SOME COMMON INITIAL QUESTIONS

- ▶ Two key resources
  - ▶ [code.visualstudio.com/docs/setup/setup-overview](https://code.visualstudio.com/docs/setup/setup-overview)
  - ▶ [helpx.adobe.com/coldfusion/coldfusion-builder-extension-for-visual-studio-code/get-started-coldfusion-builder-extension-visual-studio-code.html](https://helpx.adobe.com/coldfusion/coldfusion-builder-extension-for-visual-studio-code/get-started-coldfusion-builder-extension-visual-studio-code.html)
- ▶ Note that CFB's design requires Java be installed, JAVA\_HOME env var defined
  - ▶ More on this later
- ▶ Both tools are very simple, can start working with them within seconds (right now)
  - ▶ But with both, there's *much* you can learn to be more productive, as we will see!

# INSTALLING VSCODE & CFBUILDER

- ▶ Some folks are adamantly against MS licensing, not wanting MS telemetry, etc.
- ▶ VSCodium ([vscodium.com](https://vscodium.com)) is built from same VSCode open source
  - ▶ But no MS license (is permissive MIT license instead)
  - ▶ No MS Telemetry
    - ▶ FWIW, note that MS Telemetry can easily be DISABLED in VSCode
  - ▶ No MS branding; lacking some MS-provided features
- ▶ VSCodium also uses its own marketplace ([open-vsx.org](https://open-vsx.org)): CFB not offered there
- ▶ But you CAN implement easily CFB within VSCodium...

## IMPLEMENTING CFB IN VSCODIUM

- ▶ You would use the VSCode feature to install an extension via its “vsix” file
- ▶ You can no longer obtain those from VSCode marketplace, but can either:
  - ▶ Install CFB on VSCode and use “download vsix” under gear on all extension pages
  - ▶ Downloading the extension at [vsixhub.com/vsix/96583/](https://vsixhub.com/vsix/96583/)
- ▶ Then in VSCodium, use “install from VSIX”, either:
  - ▶ From Extensions tab, under its “...” (actions), choose “install from VSIX”
  - ▶ Using Palette, type “install from VSIX”
  - ▶ Point to the vsix downloaded above, then it’s installed instantly just like on VSCode

## IMPLEMENTING CFB IN VSCODIUM (CONT.)

# FEATURES AND BENEFITS

- ▶ So many: code formatting, code folding, terminal, word wrap themes ...
  - ▶ File comparison, timeline, git integration, emmet expansion for html/css/more, AI, more...
- ▶ Could do literally for multiple talks on these alone
  - ▶ I'll point out at end resources for these and many more VScode capabilities
- ▶ Most available via either menus, buttons, keyboard shortcuts (configurable), or...
- ▶ Perhaps most important vscode tip: USE THE PALETTE!
  - ▶ Access with *View>Command Palette* menu or *ctrl-shift-p* (or more simply *F1*) keystroke
  - ▶ Start typing, to access world of feature possibilities
  - ▶ Note that it remembers the most recently used ones at the top

# VSCODE FEATURES

- ▶ IntelliSense/Code assist
  - ▶ Cfml tags, functions, script statements appear as you start typing their name
    - ▶ Can hit enter to select before completion (or use arrows to select)
  - ▶ Hit space on tag to see popup description and attributes of tags, ctrl-space to see values
  - ▶ Tag completion (closing tag offered after ending opening tag, where appropriate)
  - ▶ Syntax help: mouse over a tag to see more help, and link to CF docs
- ▶ And still more ...

## CFB BASIC FEATURES

- ▶ As well as:
  - ▶ Color coding
  - ▶ Code formatting (that recognizes CFML, cfscript)
  - ▶ Hover help
  - ▶ Code navigation/outlining/folding
  - ▶ Code insertion/wrapping (comments, dump, abort, as tags or script), #s, more
- ▶ Also supports these features for HTML, JavaScript, CSS
- ▶ And there are still more powerful features. More on them in a moment
- ▶ But what if you don't like the choices Adobe made? ...

## CFB BASIC FEATURES (CONT.)

- ▶ On a CFM page, click “Profile Preferences” in lower right (or use palette: *Profile Preferences*)
  - ▶ Can control tag closing, auto-quoting, indentation, white space insertion, wrapping, braces, and more
  - ▶ Also offers profiles to save grouped settings
- ▶ Still a few other settings for the CFB extension:
  - ▶ Click Extensions in sidebar, right-click installed ColdFusion Builder extension
    - ▶ choose “settings” (also available by left-click of gear icon shown for extension)
  - ▶ (Or use palette> @ext:com-adobe-coldfusion.adobe-cfml-lsp)
- ▶ ...

## CONFIGURABILITY OF CFB

- ▶ Can also modify/view keyboard shortcuts for CFB features
  - ▶ Use steps above but choose “keyboard shortcuts” instead of “settings” (for CFB)
  - ▶ Shown over 80 CFB features/commands and their shortcuts
    - ▶ About 1/3 have shortcuts assigned: can change/remove
    - ▶ Can add shortcuts to any of the rest
- ▶ Can also configure the shortcuts for hundreds of VSCode feature
  - ▶ (remove the search value shown at top, @ext:com-adobe-coldfusion.adobe-cfml-lsp)
  - ▶ More on configurability of VSCode, later
- ▶ Several powerful CFB features require more than just “opening a CFM file”...

## CONFIGURABILITY OF CFB (CONT.)

- ▶ These include:
  - ▶ Code refactoring, “quick fix” capabilities
  - ▶ Security code analysis
  - ▶ Code profiler (in association with CF PMT)
  - ▶ Step debugging
  - ▶ Server management
  - ▶ RDS: Remote access for code, datasources, and more
  - ▶ SQL building, editor
  - ▶ Log viewer
  - ▶ Services browser
- ▶ If this was a daylong workshop I’d demonstrate each, showing their power
  - ▶ Again, other resources do that, which I offer in this talk
- ▶ Key: these need info in your CF server admin config, or the relationship of files (as “project”)...

## CFB FEATURES THAT REQUIRE ADDITIONAL CONFIGURATION

- ▶ Define a “project” holding your CF code, which requires first a “workspace”
  - ▶ Workspace can technically be anywhere, just a folder where a file of metadata is put
  - ▶ Project is the actual location of your CFML code
    - ▶ That code can be anywhere, need NOT be in cf’s “wwwroot”
    - ▶ But some features will only work if it’s a folder accessible by some URL in your browser
  - ▶ [helpx.adobe.com/coldfusion/coldfusion-builder-extension-for-visual-studio-code/project-manager.html](https://helpx.adobe.com/coldfusion/coldfusion-builder-extension-for-visual-studio-code/project-manager.html)
- ▶ I just learned that a coming update will remove requirement of a workspace
- ▶ Then some features require also rely on defining connection to a CF “server”...

## DEFINING A WORKSPACE, PROJECT

- ▶ Under CF logo, configure a CF “server”, pointing to your CF instance
  - ▶ Defining access to CF instance, local or remote (domain/ip, port, RDS password)
    - ▶ If remote, your CFB machine must be able to reach that port of course
  - ▶ [helpx.adobe.com/coldfusion/coldfusion-builder-extension-for-visual-studio-code/add-coldfusion-builder-vscode-extension.html](https://helpx.adobe.com/coldfusion/coldfusion-builder-extension-for-visual-studio-code/add-coldfusion-builder-vscode-extension.html) (that's not a mistaken URL)
- ▶ Notice how this enables the RDS File View and RDS Dataview features
- ▶ Also empowers features where CFB needs CF config like datasources, mappings, etc.
  - ▶ These are what require that the “project” be connected to a “server”
  - ▶ Step debugging and security analyzer also require connection of “project” to “server”
- ▶ When pointing to Commandbox instance, may get “invalid server home” error
  - ▶ See my solution(s):
  - ▶ [community.ortussolutions.com/t/commandbox-visual-studio-code-adobe-coldfusion-builder-extension-with-commandbox/9376/5](https://community.ortussolutions.com/t/commandbox-visual-studio-code-adobe-coldfusion-builder-extension-with-commandbox/9376/5)

## DEFINING A “SERVER”

# COMPARISON TO OTHER VSCODE CFML EXTENSIONS

- ▶ Newer/currently updated
  - ▶ **CFMLEditor** (cfmleditor.cfmleditor), from Gareth Eddies, forked from KamasamaK (below)
  - ▶ **Boxlang** (ortus-solutions.vscode-boxlang), for boxlang (with cfml support as forked from Vadim below)
- ▶ Older/orphaned/no longer updated
  - ▶ **Vscode-cfml**, from Vadim Sibiryanskiy, last updated in 2023, which was a fork of...
    - ▶ **Vscode-cfml**, aka “**CFML**”, “**Kamasamak**” (kamasamak.vscode-cfml), last updated 2022, adapted from:
      - ▶ **vscode-coldfusion**, aka “**ColdFusion**” (ilich8086.coldfusion), from Ilya Verbitskiy, last updated 2018
    - ▶ **ColdFusion**, aka “Sketchpunk” (sketchpunk.coldfusion), last updated in 2015
    - ▶ And more (note some are Lucee-only, like “CFML Formatter”)
- ▶ Beware judging them by “Install Count”, older ones naturally have larger values
  - ▶ Note that VSCode default sort order is an undefined algorithm: not install count, rating, update date

FAMILY TREE TIME:  
SOME NEW, MOST ORPHANED

- ▶ Considering all those built from kamasamak, ilya, vadim, etc.
- ▶ Things they offer (which CFB does as well)
  - ▶ Color coding, code formatting, hover help, code assist, snippets
  - ▶ Ample (different) configurability of these things
- ▶ Things they offer which CFB does not
  - ▶ Linting (static code analysis, enforcing coding standards)
    - ▶ Bundling CFLint extension (KamasamaK.vscode-cflint), which can be added to CFB
  - ▶ Don't require java like CFB, nor use of project or workspace like CFB does for some features
  - ▶ And for many people, the above may seem “enough” to code CFML on VSCode
- ▶ Things CFB offers that they do not
  - ▶ Recall those 10 features listed previously, which rely on defining a project, perhaps server

## WHAT DID/DO OTHERS OFFER FOR CFML?

# MORE ON CFB AND VSCODE

- ▶ Error: “Java version greater than 7 is required to run CFML extension”
  - ▶ Must set JAVA\_HOME env var
  - ▶ [helpx.adobe.com/coldfusion/coldfusion-builder-extension-for-visual-studio-code/get-started-coldfusion-builder-extension-visual-studio-code.html#install](https://helpx.adobe.com/coldfusion/coldfusion-builder-extension-for-visual-studio-code/get-started-coldfusion-builder-extension-visual-studio-code.html#install)
- ▶ Again, some features won't work unless CFB “project” is defined, others need “server”
- ▶ VSCode “Restricted mode”
  - ▶ If you open a folder that vscode does not yet recognize, it will be in “restricted mode”
  - ▶ CFB features won't work because all extensions will be enabled or limited
  - ▶ Can choose to “trust” (the authors of) the folder in question or its parent
- ▶ Other extensions may cause conflict
  - ▶ Can “disable” for all of VSCode, or a specific workspace (no need to “uninstall”)
- ▶ ...

## SOME FREQUENT CFB/VSCODE CHALLENGES

- ▶ CFB sometimes forgets/does not preserve display of projects
  - ▶ Only affects features that require that be configured, can “import” project definition
- ▶ VSCode features that may annoy you:
  - ▶ “sticky scroll”: right-click when it appears, to disable
  - ▶ “minimap” (on right): right-click and select “minimap” (to disable)
  - ▶ AI/copilot feature popups: *file>preferences>settings>disableai*
- ▶ Beware: if you open a different folder (*file>open folder*), will be prompted to save unsaved tabs
  - ▶ Doesn’t happen if you open just a file
  - ▶ What if you don’t want to lose tabs? Can instead open a new window...

## SOME FREQUENT CHALLENGES (CONT.)

- ▶ You can open a new window: *File>New Window*; then *File>Open Folder*
  - ▶ Also, if that folder has no extensions associated with it yet, can choose to enable any
  - ▶ Allows you to try different extensions (no need to “uninstall” one you don’t want)
- ▶ Can also open new window with new “profile” (giving it a name), and enable only some extensions
- ▶ Note when viewing files in file explorer (top left icon in vscode):
  - ▶ If you single-click a file, it opens in a tab but does not STAY open if you click another
  - ▶ If you double-click a file, it opens in a tab and stays open until you close it
- ▶ Like many modern editors, can close without saving text. Still there on re-open
- ▶ ...

## SOME MORE VSCODE TIPS

- ▶ Can sync VSCode settings across machines (where you log in)
- ▶ Can opt out of VSCode collection of telemetry/usage data
- ▶ Can enable emmet text expansion for html, css, js
  - ▶ To enable that within CFML files, add to vscode settings.json:

```
"emmet.includeLanguages": {  
  "cfml": "html"  
}
```
- ▶ And again really so much more I COULD point out

## SOME MORE VSCODE TIPS (CONT.)

## ▶ Snippets?

- ▶ *File>Preferences>Configure Snippets*
- ▶ Select “cfml.json”, see comments in the file for how to configure your own snippets
- ▶ Insert them using Command Palette: *Snippets: Insert Snippets*

## ▶ FTP?

- ▶ CFB offers no features for that, but extensions exist (consider SFTP, SSH, RDS)

## ▶ Wysiwyg html editing?

- ▶ VSCode does not offer that natively

## ▶ Configuring quick-access buttons?

- ▶ CFBuilder enables several actions on top right, not configurable it seems

# WHAT ABOUT...?

- ▶ I realize some have long stuck with older CFML editors
  - ▶ DW: support for CF (and ASP, JSP) dropped in 2013, never updated for newer CFML
  - ▶ CF Studio (dropped in 2001), HomeSite+ dropped in 2009
- ▶ Many still favor Notepad++, Sublime Text, others
  - ▶ CFML support for them ended (2011 and 2012, respectively)
- ▶ Still, folks love how they open fast, are straightforward
  - ▶ Still, each has their own ways of doing things (keystroke, Uis, snippets, etc.)
- ▶ Note that there are VSCode extensions to ease NP++, Sublime transition

## TO DIEHARD USER OF OLDER EDITORS

- ▶ Consider VSCode, CFB logs
  - ▶ Open Palette (F1), then type Developer: Open Extension Logs Folder
- ▶ There have been 4 CFB updates (in 2025, 2024, and 2023)
- ▶ Can log bugs, feature requests in *tracker.adobe.com*
  - ▶ select “ColdFusion Builder Extension for VSCode” as product
  - ▶ Currently only 17 filed (just 5 from 2025); 11 marked “to fix”
- ▶ Seek help from community: *cf411.com/cfsocialhelp*
- ▶ Can email Adobe: *cfsup@adobe.com*
- ▶ Reach out to me directly, will help where I can (free or perhaps as consulting)

## RESOLVING PROBLEMS

- ▶ I get it: some are happy with the CFML extension they use
  - ▶ Or they've tried CFB and hit problems, and may still not be motivated to seek solution
- ▶ Maybe you just prefer older editors, whether they support CFML or not
  - ▶ I'll just note that you could just as readily use VSCode to edit CFML without CFB, etc.
- ▶ Even for both audiences, consider that you could STILL use CFB
  - ▶ Such as to perform the CF Code Security Analyzer feature
  - ▶ Or perhaps the PMT profiler feature, or even the CFML step debugger feature, etc.

## WHAT IF YOU'RE STILL NOT SOLD ON CFB?

- ▶ See front page when extension is selected, offers reminders, doc links, or see:
  - ▶ [helpx.adobe.com/coldfusion/cfb-extension-vs-code-plugin-user-guide.html](https://helpx.adobe.com/coldfusion/cfb-extension-vs-code-plugin-user-guide.html)
  - ▶ Many sections/docs below that (expand left nav bar). Let's visit...
- ▶ Beware search engines/Ais/posts pointing to docs for OLD CFBuilder...
  - ▶ Not:
    - ▶ [helpx.adobe.com/coldfusion/using-coldfusion-builder/managing-projects.html](https://helpx.adobe.com/coldfusion/using-coldfusion-builder/managing-projects.html)
  - ▶ But:
    - ▶ [helpx.adobe.com/coldfusion/coldfusion-builder-extension-for-visual-studio-code/project-manager.html](https://helpx.adobe.com/coldfusion/coldfusion-builder-extension-for-visual-studio-code/project-manager.html)

## FINDING MORE INFO ON CFB

- ▶ *Help>Open Walkthrough* (also offers videos)
- ▶ *Help>Editor Playground* (guides)
- ▶ *Help>Documentation* ([code.visualstudio.com/docs](https://code.visualstudio.com/docs))
- ▶ *Help>Keyboard Shortcuts Reference*
- ▶ [code.visualstudio.com/docs/getstarted/introvideos](https://code.visualstudio.com/docs/getstarted/introvideos)
- ▶ [code.visualstudio.com/docs/getstarted/getting-started](https://code.visualstudio.com/docs/getstarted/getting-started)
- ▶ [code.visualstudio.com/docs/getstarted/tips-and-tricks](https://code.visualstudio.com/docs/getstarted/tips-and-tricks)
- ▶ Many community resources: blog posts, videos, courses (LinkedInLearning, Udemy, etc.)

## FINDING MORE INFO VSCODE

- ▶ I'll add that I am contemplating creating an online course
  - ▶ Send email to [support@carehart.org](mailto:support@carehart.org), subject "course", if interested to be notified
- ▶ Adobe has offered speakers a \$25 gift card to giveaway
  - ▶ I'll offer it to the 5<sup>th</sup> person to send that email now 😊
- ▶ If time remains, some quick demos
  - ▶ Otherwise, while we await emails, let's move on to conclusion

FINALLY...

- ▶ CFB is more than just Adobe's extension: also all of VSCode (and its abilities)
  - ▶ CFB adds many features that other CFML extensions don't support (for better or worse)
- ▶ Ample resources exist to learn more about both CFB and VSCode
  - ▶ Many concerns/complaints have been/can be resolved, or can reach out to Adobe
- ▶ Again, my contact info for follow-up:
  - ▶ Charlie Arehart
  - ▶ [charlie@carehart.org](mailto:charlie@carehart.org)
  - ▶ @carehart (Slack, Github, X, FB, LinkedIn, etc.)
  - ▶ Slides: [carehart.org/presentations](https://carehart.org/presentations)
- ▶ With that, hope you enjoyed the talk!
  - ▶ Use QR code for slide deck
- ▶ ...time for questions?

## SUMMARY
